Hello World - The Brainstorming

The first proper conversation where NAVISense started taking shape.

PROJECT MOMENT

First Planning Session

PREPARED BY

NAVISense Team

Executive signal

This first planning session gave NAVISense its starting shape: a clear direction, a shared idea, and a team ready to split the work without losing the group discussion.

1 Quick Recap

This was the first real brainstorming moment for NAVISense. We reunited as a team and had a deeper discussion about what the project could become, starting from the idea behind the prototype and moving into its possible applications, main audiences, and future support systems.

During this discussion, we tried to locate NAVISense more clearly, not only as a vest, but as a system that could combine the physical prototype with other infrastructure nodes, such as monitoring tools or communication platforms. We also looked at the current market and analyzed similar or alternative solutions, which helped us understand what already exists and where our project could bring something different.

After this first positioning of the project, we also discussed the parts around the prototype itself, such as the poster, the video, and the website. This led us to start separating the project into different areas, including the physical prototype, software development, and presentation/communication side. The work became more organized, but the idea was still to keep the project collaborative and open between everyone.

2 Prototype Ideas

- The prototype would be a wearable vest, designed to be comfortable and visually appealing, but not necessarily beautiful, since some users could potentially wear it on a daily basis.
- The vest should detect nearby obstacles and provide simple haptic feedback, allowing people with visual impairment or mobility difficulties to perceive elements of the environment without relying on visual or audio cues.
- The system should eventually connect the vest, a mobile app, and a monitoring dashboard. Since this type of product could be useful both for people who need assistance and for users in dangerous situations, such as firefighters, we started thinking about NAVISense as a connected system with several support nodes.
- From a marketing and identity perspective, we concluded that the project should have a strong and recognizable visual identity. For that reason, we started defining a main color scheme and visual style for the website, pitch deck, and poster, so all materials would communicate the same story.

3 Team Setup

The project was separated into three main domains: Prototype, Software, and Presentation. We decided to assign two people to each area, so every part of the project would have clear responsibility and continuity.

Prototype: Francisco and Raquel;

Software: Daniel and Frederico;

Presentation: David and Tiago;

However, we did not want this division to create isolated groups. Our philosophy is that the project is still built

by everyone, and each team member can support other areas when needed. For example, if Daniel is free from software development tasks, he can help Tiago with poster design or presentation work.

We believe this makes the project feel more like real teamwork, instead of a set of disconnected micro-teams. Keeping communication open between areas should help us avoid coordination problems and make the final result more coherent.

Francisco	4G integration, public relations, and data transmission.
Raquel	Vest design, sensor choice, and sensor positioning.
Daniel	Website design and dashboard elements.
David	Demonstration video, data transmission, and data acquisition.
Tiago	Pitch deck, vest design, and poster design.
Frederico	Dashboard programming, dashboard design, and dashboard elements.

4 Next

- Turn the idea into a clearer project timeline.
- Start researching materials, sensors, communication options, and dashboard needs.
- Prepare the first proposal and keep refining the prototype direction.
